OrenGen | Enterprise AI Infrastructure <sales@orengen.io>
To: OrenGen | Enterprise AI Infrastructure <sales@orengen.io>

Thu, Jun 25, 2026 at 3:57 PM

Claude, I need you to make me a HTML of our sales partner program that's one hundred percent commission based, and I want it to be able to have, uh, where it can do auto calculations where people can see what they can potentially make. So let's start with letting them know that we have the scripts and the leads to contact potential customers for new websites or revised websites. The standard price is nine hundred and ninety seven dollars. Setup fee, and it's two hundred and forty seven dollars a month for maintenance. Each sales partner... well, each sales... one hundred percent sales partner will get thirty five percent of the initial fee, and they will get twenty five percent residual income for the life of the customer, and they can have a toggle that would... that could tell them how many to hit their own personal financial goals. They can set it to how ever many customers that they want to sell a day or whatever. And I wanted to auto calculate what they what they could make weekly, monthly, yearly based on a selection.

Architected interactive commission calculator with dynamic earnings projections
Architected interactive commission calculator with dynamic earnings projections
Here's your full Sales Partner Program page. Here's what's packed into it:

Hero Section

Interactive mini-calculator embedded right in the headline — drag the slider (1–10 sales/day) and the yearly earning estimate animates live. Opens at \$180,078 for 1 sale/day, scales up dramatically.
Commission Breakdown

4 cards showing the full picture: \$997 setup → your \$348.95 upfront, \$247/month maintenance → your \$61.75/month residual forever
Full Income Projector Calculator

Toggle between Per Day / Per Week / Per Month closing pace
Animated slider with real-time number updates
Three result cards: Weekly (upfront), Monthly (upfront + Month 1 residual), and Year 1 Total with Month 12 passive income shown
12-Month Residual Growth Bar Chart — visually shows the income compounding from Month 1 through Month 12 as the client base stacks
Goal Calculator

Partner enters their target (e.g., \$5,000) and picks weekly/monthly/yearly
It tells them exactly how many sales/day they need, plus what their Month 6 and Month 12 residual will look like — this is the closer
What You Get section, branded CTA, and legal disclaimer all included.

Want me to add an "Apply Now" form directly on the page, or adjust commission tiers, pricing, or colors?

OrenGen sales partner program

Code · HTML
Can you help me to build my own custom software affiliate or sales partner software in order to do my own custom tracking that I could... I don't know. I guess, have webhooks from my GoHigh Level system or any other system that I can do tracking with to make sure that, uh, they're being paid out accurately, and they can track their own, uh, their own sales.

I dont want to buy any affiliate systems when I can build my own

Jun 12

Architected custom partner tracking platform leveraging existing stack
Architected custom partner tracking platform leveraging existing stack
Smart call — your model doesn't even fit off-the-shelf affiliate tools. Those are built around cookie/link attribution. Your program is rep-based attribution (OrenGen provides the leads, the partner owns the deal), which means deals get assigned, not tracked by click. That's simpler to build, and it becomes MansaCore IP you can white-label later. Here's the build plan.

Architecture (on your existing stack)
Postgres (Coolify on OVH) is the source of truth — an immutable commission ledger. n8n ([automate.orengen.io](#)) is the webhook ingestion layer. Next.js partner portal for partner logins/dashboards. PayPal Payouts API for batch payments. No new infrastructure, no SaaS fees.

The core design principle that guarantees payout accuracy: every commission is a row, created by an event, never edited — only status changes (pending → approved → paid). If a number's ever disputed, you trace it back to the exact webhook that created it.

Data model (6 tables)
sql
partners -- id, name, email, referral_code, -- paypal_email, status, plan_id
plans -- upfront_pct (0.35), residual_pct (0.25)
deals -- id, partner_id, ghl_contact_id, -- setup_fee, mrr, status -- (active/churned), closed_at -- raw webhook log: source, event_id -- payload JSONB, received_at (immutable)
commissions -- id, deal_id, partner_id, type -- (upfront/residual), amount, period, -- status, source_event_id
payouts -- id, partner_id, total, method, -- batch_id, status, paid_at
Unique constraint on commissions (deal_id, type, period) = built-in idempotency. GHL can fire a webhook twice and you'll never double-pay.

GHL webhook → commission flow
Deal won → GHL workflow trigger "Opportunity moved to Won" → webhook to n8n → looks up partner (custom field on the contact/opportunity), creates deal + one upfront commission (\$348.95, pending)
Monthly payment succeeds → \$247 invoice paid (GHL Payments/Stripe webhook) → n8n creates one residual commission (\$61.75) for that month. Residuals are payment-driven, not calendar-driven — partners only earn when the client actually pays. Protects your cash flow.
Refund/cancellation → negative commission row (clawback) or deal marked churned, residuals stop automatically.
Every inbound webhook gets logged to events first, then processed — full audit trail.
Partner portal
Magic-link login → dashboard showing: deals closed, upfront earned, active client count, current monthly residual run-rate, lifetime earnings, payout statements. Drop in the goal calculator from the page we just built. Partners self-serve; you stop answering "what am I owed?" texts.

Payouts
Monthly cron (e.g., NET-15): you review pending commissions in an admin view → approve → n8n batches per-partner totals → PayPal Payouts API → rows flip to paid, statement generated. One approval click, fully auditable.

Build phases
Week 1: Postgres schema + n8n ingestion workflows + GHL workflow webhooks — tracking is live
Week 2: Partner portal + admin approval view
Week 3: PayPal payout batching + statements
Later (productize): white-label theming, multi-tenant, sell it as a GHL companion SaaS
One thing to confirm before I start generating Phase 1: how is the \$247/month actually billed — GHL Payments, direct Stripe, or PayPal invoicing? That determines which payment webhook feeds the residual engine.

Say the word and I'll build the Phase 1 packet: full SQL schema, the n8n workflow JSONs (deal-won + payment-received + dedupe logic), and the GHL setup steps.

Stripe but cant I make the software dual to build an affiliate army (one side of it because i can add that to multiple platforms bit them only get tracking links but id need help on the payouts and tiers if any) and also the 100% commission sales partner side(which they would get a number, access to the crm, lead access, etc) and i dont see any complications to all the to be both an affiliate and sales partner, but im sure you'll give me the breakdown.

Also I currently have [weshare.orengen.io](#) that we can use to finish building all the way out with your super enhanced updated system and structure.

Jun 12

Architected dual-sided affiliate and partner system with unified ledger
Architected dual-sided affiliate and partner system with unified ledger
You're right that there's no complication — if we solve one thing correctly: attribution collision. That's the only place a dual system breaks, and it's solved with lead-source tagging. Here's the full breakdown for WeShare on [weshare.orengen.io](#).

The Two-Sided Model
Affiliate Army Sales Partner
Attribution Tracking link + cookie Deal assignment in GHL
Gets Link, dashboard, creatives Number, CRM seat, house leads, scripts
Effort Promotes, never sells Closes deals
Pay Smaller %, tiered 35% / 25% lifetime
Scale Thousands Curated roster
Key architecture insight: these are two attribution engines feeding one commission ledger and one payout rail. A person with both roles gets one login, one consolidated payout, one statement showing both income streams. That's what makes "both" trivial instead of messy.

The Stacking Rules (the breakdown you asked for)
Every lead gets a source tag at creation: house, affiliate, or partner_sourced. Commissions follow the tag:

House lead → partner closes: Partner commission only. Affiliate codes are blocked on house leads — otherwise partners run your leads through their own links to skim an extra cut. This is the #1 leak in dual systems; the source tag kills it.
Affiliate link → different partner closes: Both paid. Affiliate ~10% setup + partner 35% = 45% out, you keep \$548 of \$997. Healthy.
Affiliate link → same person closes as partner: Both paid (stacked). This is intentional — it rewards partners for generating their own pipeline instead of living off house leads. Your best hybrid hustlers become self-feeding.
Proposed Affiliate Tiers (approve or adjust)
Tier Converted referrals/no Setup cut Residual
Bronze 0–2 10% (\$99.70) 5% × 12 mo
Silver 3–7 15% (\$149.55) 5% × 12 mo
Gold 8+ 20% (\$199.40) 7.5% lifetime
Affiliate residuals are time-capped except Gold — lifetime residual stays the partner's premium, and Gold lifetime becomes the carrot that builds the army. Tier engine auto-promotes/demotes monthly on trailing volume; the rate is snapshotted onto each commission row so history never mutates.

Schema delta (added to what we scoped)
users + roles (one identity, multiple roles) → affiliate_profiles (code, tier) + partner_profiles (GHL user ID, assigned number) → links, clicks (high-volume, IP-hashed), leads (with source + affiliate_id), tiers — all flowing into the same events → commissions → payouts ledger. The commissions table gains one column: role_context (affiliate | partner).

[weshare.orengen.io](#) map
/r{code} — redirect engine: logs click, sets 60-day first-party cookie, 302s to your landing page with ?ref= appended. GHL form captures ref in a hidden field → that's your attribution match (param primary, cookie fallback).
/dashboard — role-aware portal (affiliate view, partner view, or both)
/admin — your command center: approval queue, payout runs, tier overrides
Affiliates can generate multiple links pointed at different destinations/campaigns — that's how the same army works across all your platforms and offers.
Payouts — one upgrade since you confirmed Stripe
Recommend Stripe Connect Express over PayPal Payouts: money's already in Stripe, payouts become transfers, and Stripe auto-generates 1099s for every affiliate/partner. At army scale, tax-form automation alone justifies it. PayPal stays as fallback for anyone who refuses Connect onboarding.

Stripe webhooks drive the ledger: invoice.payment_succeeded → residual rows; charge.refunded → clawback row; subscription.deleted → churn, residuals stop.

Fraud guards (affiliate armies attract gamers)
Click dedupe by IP+UA hash, self-purchase blocking, conversion-window enforcement, and a manual-review hold on every affiliate's first payout.

Build phases
Schema + /r/ click tracker + GHL/Stripe webhooks via n8n → tracking live
Portal auth + both dashboards
Connect onboarding + batch payouts + statements
Tier automation, fraud rules, admin analytics
Multi-tenant white-label → MansaCore product (this is a sellable GHL companion SaaS)
Three sign-offs and I start generating: (1) tier table above — approve or edit rates, (2) 60-day attribution window OK?, (3) Stripe Connect as payout rail? Give me those and I'll build the Phase 1 packet: full SQL, the redirect service, and the n8n workflow JSONs.

Im going to lean on you to create the tier table and the rest, because I want a MASSIVE amount of affiliate FAST and for them to stay. Its tons of affiliate opportunities but many dont sign up because it doesn't compel them to put in some elbow work and love the outcome and WANT yo tell others to join them with glee!

I need your guidance.
We can do that
Jun 12

Architected gamified tier system with compliance guardrails and build specifications
Architected gamified tier system with compliance guardrails and build specifications
Done deliberating — here's the system, engineered for three outcomes: join fast, never quit, recruit with pride. Then I built the full Phase 1 packet below.

The WeShare Tier Ladder
Ranks are earned by lifetime sales — you can never be demoted. That single rule is your retention engine (demotion is the #1 reason affiliates rage-quit programs) and a recruiting headline no competitor matches.

Tier Unlock Setup Cut Monthly Residual Army Override
🔥 Catalyst Free signup 10% (~\$100) 5% (\$12.35) × 12 mo —
🔨 Builder 3 sales 15% (\$150) 5% × 24 mo 5% of recruits' sales, 12 mo
🏗 Architect 10 sales 20% (\$199) 7.5% (\$18.53) lifetime 5%, 24 mo
👑 Sovereign 25 sales 25% (\$249) 10% (\$24.70) lifetime 5% lifetime + 2.5% residual override
The glee mechanics layered on top:

Fast Start Bonus — extra \$50 if their first sale lands within 14 days. First check comes fast: endowed-progress kicks in.
Milestone cash — \$100 at Builder, \$500 at Architect, \$1,500 at Sovereign. Tier-ups fire instantly on the qualifying sale with a celebration email, not in a monthly batch.
The Army Override is the viral engine — it unlocks at Builder, meaning they must sell 3 before they can sponsor. That's the "elbow work" gate: only proven affiliates recruit, recruits join under someone who can actually show a check, and quality stays high.
The pitch writes itself: "Free to join. ~\$100 per sale. Monthly checks that grow forever. A cut of everyone you bring in. And you can never lose your rank."
Your margin floor (worst-case full stack — Sovereign affiliate + Sovereign upline + partner closes): OrenGen still keeps \$349 of every setup and \$154/mo of every \$247 — forever. The house always wins on the residual.

Compliance guardrails — non-negotiable, and they're in the spec
Attribution (my guidance): 90-day window — long windows are themselves a recruiting feature. Mechanically: /r{code} → 302 with ?ref= → GHL hidden field → lead-lock. Once a lead exists with an affiliate ID, it's locked permanently (param-first, cookie-fallback, last-click wins pre-lock). House leads stay blocked from affiliate codes; self-referrals auto-rejected.

Payouts: Stripe Connect Express it is — NET-15 monthly, \$25 minimum (rolls over), 14-day review hold on first payouts only, auto-1099s.

Building the packet now.

Created a file, read a file
Created a file, read a file
The full Phase 1 packet is above — copy-paste-runnable schema, the redirect service code, all five n8n workflow specs, plus Stripe and GHL checklists with a step-by-step build order.

Next move is yours: I can generate the importable n8n workflow JSON files (WF-A through WF-E, ready to drop into [automate.orengen.io](#)), or jump to the WeShare signup/recruiting page — the public-facing pitch built around "Free to join. ~\$100 per sale. Checks that grow forever. You can never lose your rank." Which one first?

Weshare build packet v1
Document · MD
Can you also write the sop's, rules etc end to end for both sides? And ad copy?

Jun 12

Architected four comprehensive documents spanning affiliate handbook, partner handbook, internal operations, and ad copy pack
Architected four comprehensive documents spanning affiliate handbook, partner handbook, internal operations, and ad copy pack
Four files built — both member-facing handbooks, the internal ops manual, and the full ad copy pack. I made the operational policy calls you delegated; they're flagged at the end for ratification.

Created 4 files, read a file
Created 4 files, read a file
All four delivered:

Affiliate Handbook — earnings, onboarding SOP, daily playbook, attribution rules, payout rules, FTC requirements, prohibited tactics. Army Builder rules, strike system, disputes
Partner Handbook — comp terms, onboarding/certification, full lead lifecycle SOP, sales call rules, communication compliance, CRM hygiene, non-circumvention, exit policy
Internal Ops SOP — your side: application review, daily checklist, monthly payout run, fraud review, dispute resolution, clawback, termination, weekly KPIs
Ad Copy Pack — 14 headlines, FB/IG ads, TikTok script, LinkedIn posts, DM/SMS, emails, peer-to-peer Army Builder copy, hero lines, and the mandatory disclaimer block
Policy calls I made on your behalf — ratify or adjust:

Lead SLA: first touch in 4 business hours, 6 touches over 10 days, 48h no-contact = lead recycles
Clawback window: 30-day refund reversal
Partner exit in good standing keeps lifetime residuals (the promise holds); for-cause termination forfeits
3-strike system for minor violations; instant termination for fraud/circumvention/spam
\$50 Fast Start requires close within 14 days of signup
One thing these documents reference but can't replace: the actual Affiliate Agreement and Sales Partner Agreement — the signed contracts these handbooks hang off of. I can draft both as working templates, but given real money and clawback/forfeiture clauses, have a Texas attorney review before anyone signs. Want me to draft those next, or move to the n8n workflow JSONs?
